

Australian Standard™

**Aluminium and aluminium alloys—
Anodic oxidation coatings**

This Australian Standard was prepared by Committee MT/9, Metal Finishing. It was approved on behalf of the Council of Standards Australia on 16 June 2000 and published on 19 July 2000.

The following interests are represented on Committee MT/9:

- Australasian Institute of Metal Finishing
- Australian Chamber of Commerce and Industry
- Australian Industry Group
- Department of Defence (Australia)
- Galvanising Association of New Zealand
- Galvanizers Association of Australia
- Institute of Materials Engineering Australasia
- Powder Coaters Association
- Royal Australian Chemical Institute
- Society of Automotive Engineers, Australasia
- Telstra Corporation

Additional interests participating in the preparation of this Standard:

- Aluminium fabricators
- Anodisers
- Australian Window Association
- Technical publishers

Keeping Standards up-to-date

Standards are living documents which reflect progress in science, technology and systems. To maintain their currency, all Standards are periodically reviewed, and new editions are published. Between editions, amendments may be issued. Standards may also be withdrawn. It is important that readers assure themselves they are using a current Standard, which should include any amendments which may have been published since the Standard was purchased.

Detailed information about Standards can be found by visiting the Standards Australia web site at www.standards.com.au and looking up the relevant Standard in the on-line catalogue.

Alternatively, the printed Catalogue provides information current at 1 January each year, and the monthly magazine, *The Australian Standard*, has a full listing of revisions and amendments published each month.

We also welcome suggestions for improvement in our Standards, and especially encourage readers to notify us immediately of any apparent inaccuracies or ambiguities. Contact us via email at mail@standards.com.au, or write to the Chief Executive, Standards Australia International Ltd, PO Box 1055, Strathfield, NSW 2135.

This Standard was issued in draft form for comment as DR 99260.

Australian Standard™

**Aluminium and aluminium alloys—
Anodic oxidation coatings**

Originated as AS K150—1963.
AS 1956—1974 and AS 1231—1985 revised, amalgamated
and redesignated AS 1231—2000.

PREFACE

This Standard was prepared by the Joint Standards Australia/Standards New Zealand Committee MT/9, Metal Finishing, to supersede AS 1231—1985, *Aluminium and aluminium alloys—Anodised coatings for architectural applications* and AS 1956—1976, *Anodic oxidation coatings on aluminium for decorative and automotive applications*.

These two Standards have been combined because of the similarity of their technical content. During this revision cognizance was taken of the following International (ISO), British and American Standards:

ISO

7599:1983 Anodizing of aluminium and its alloys—General specifications for anodic oxide coatings on aluminium.

BS

1615:1987 Anodic oxidation coatings on aluminium and its alloys.

3987:1991 Anodic oxidation coatings on wrought aluminium for external architectural applications.

ASTM

B 580-79 Specification for anodic oxide coatings on aluminium

This Standard is based primarily on BS 1615 which is considered by Committee MT/9 as the most appropriate and most up-to-date of the four Standards listed.

This Standard is the result of a consensus among the representatives on the Joint Committee to produce it as an Australian Standard.

The term ‘informative’ has been used in this Standard to define the application of the appendix to which it applies. An ‘informative’ appendix is only for information and guidance.

STANDARDS AUSTRALIA

Australian Standard

Aluminium and aluminium alloys — Anodic oxidation coatings

1 SCOPE

This Standard specifies requirements for anodic oxidation coatings on aluminium and its alloys for general applications and for external architectural applications.

This Standard is not applicable to—

- (a) non-porous anodic oxidation coatings of the barrier-layer type;
- (b) coatings produced by chromic acid anodising;
- (c) hard anodic oxidation coatings that are used mainly for engineering purposes and that have abrasion and wear resistance as their primary characteristics; and
- (d) anodic oxidation coatings intended merely to prepare a substrate for subsequent application of organic coatings or the electrodeposition of metals.

NOTES:

- 1 The coatings covered by this Standard consist mainly of aluminium oxide and are produced by an electrolytic oxidation process during which the aluminium acts as the anode.
- 2 Advice and recommendations on information to be supplied by the purchaser at the time of enquiry or order are given in Appendix A.
- 3 Although not specified, the quality and composition of aluminium or aluminium alloys should be suitable for anodising. (See Appendix B).
- 4 Information on maintenance of coatings is given in Appendix C.
- 5 Advice on handling and temporary protection of anodised products during transportation and installation is given in Appendix D.

Details of wrought aluminium and aluminium-alloy product types are given in the following Standards:

- (i) Sheet and plate AS/NZS 1734.
- (ii) Drawn wire, rod, bar and strip AS/NZS 1865.
- (iii) Extruded rod, bar, solid and hollow shapes AS/NZS 1866.
- (iv) Drawn tubes AS/NZS 1867.
